

Abstract

Antiperspirant compositions containing suspended antiperspirant actives in a water-immiscible carrier leave  
5 visible deposits on skin or clothing unless the actives are masked. The carrier mixture in compositions herein comprise an alkylsiloxane which is substituted by a group  $R^4$  of formula  $-CH_2-C(Ph)(R^B)-R^5-Ph$  in which  $R^B$  represents H or methyl and  $R^5$  represents an alkylene group containing 0 to 3  
10 carbons, and in which the proportion of aryl carbon atoms is at least 60% of all carbon atoms in the molecule. Preferably, the substituent comprises diphenylethyl. Optionally, the siloxane can be capped by the residue of a substituted vinyl group other than  $R^4$  or an alkyl, cycloalkyl  
15 or aralkyl alcohol.
